Background

WorldSkills UK are an educational business focussed on the promotion of apprenticeships and technical education in the UK and beyond.

The Problem

With the advent of GDPR and increasing cybersecurity concerns in business, WorldSkills UK sought a solution that ensures their employees are cyber aware.

The Solution

Hut Six's interactive and engaging cybersecurity awareness training, phishing simulator and learning management system.

“The content has been beneficial for all staff in both their personal and professional lives. In an environment where data is becoming increasingly more valuable, this type of awareness training is a vital tool in helping organisations protect themselves from security breaches and human error.”

WorldSkills UK, an organisation focussed on the promotion of technical skills and apprenticeships, offers career advice to young people in the first stages of their careers and champions their success through training and skills competitions.

In considering the persistent threat of cyberattacks targeting the charity sector, as well as the advent of GDPR, WorldSkills UK sought a solution that would both improve employee awareness of cybersecurity related issues whilst also testing and tracking employee performance in response to potential threats or breaches.

With Hut Six's unique and engaging learning platform, WorldSkills UK have noted a positive effect on the organisation, with a better understanding of cybersecurity issues being noted by its employees in both professional and personal situations. Staff have also noticed an improved level of vigilance amongst the workforce regarding phishing emails and other potential threats.

“We have gone from a relatively basic level of awareness, when it comes to data protection and privacy, to a place where privacy by design is applied to any new project.”

- Mark Smallman, Director of Operations, Worldskills UK
